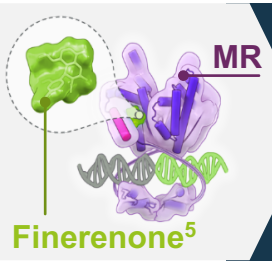
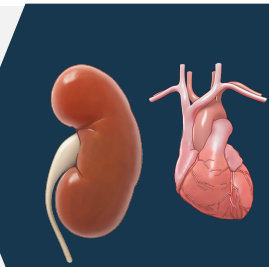
- Research grants from AstraZeneca and Novo Nordisk

The FIDELITY prespecified pooled analysis showed cardiorenal benefits of finerenone across the spectrum of CKD and T2D



Finerenone is a **novel, selective, nonsteroidal MRA** that **inhibits MR overactivation**, which is associated with **inflammation and fibrosis**[1,2]

FIDELITY was a prespecified pooled analysis of the FIDELIO-DKD and FIGARO-DKD phase III trials, which included **patients with T2D** across the **spectrum of CKD** receiving **optimized RAS inhibitor** therapy[1–3]



FIDELITY showed significant **risk reductions** of **14%** in the **CV composite** endpoint, and **23%** in the **57% kidney composite** endpoint[3]

CKD, chronic kidney disease; CV, cardiovascular; MR, mineralocorticoid receptor; MRA, mineralocorticoid receptor antagonist; RAS, renin–angiotensin system; SGLT-2i, sodium-glucose co-transporter-2 inhibitor; T2D, type 2 diabetes

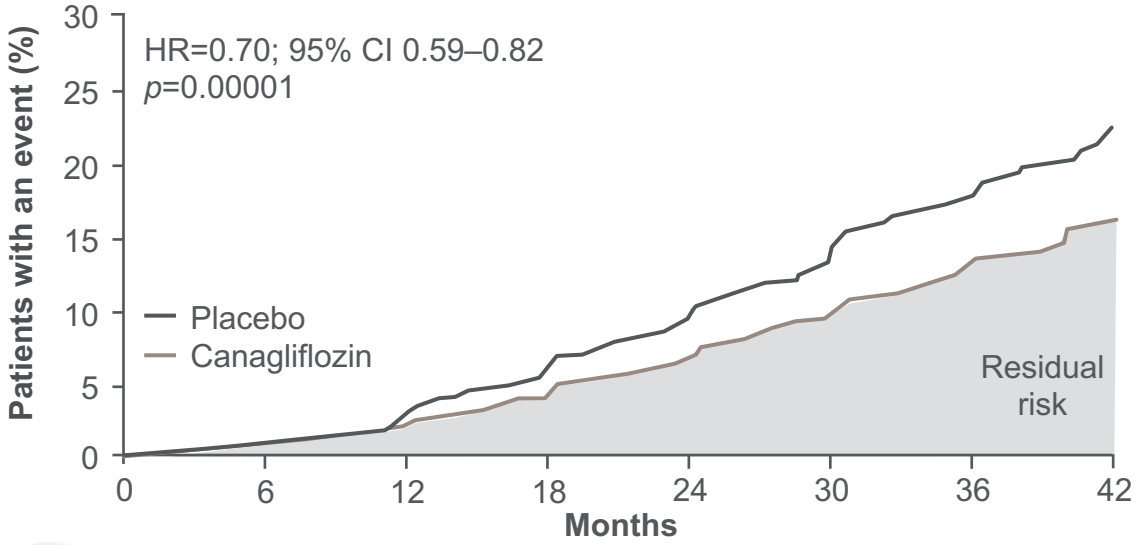
FIDELITY

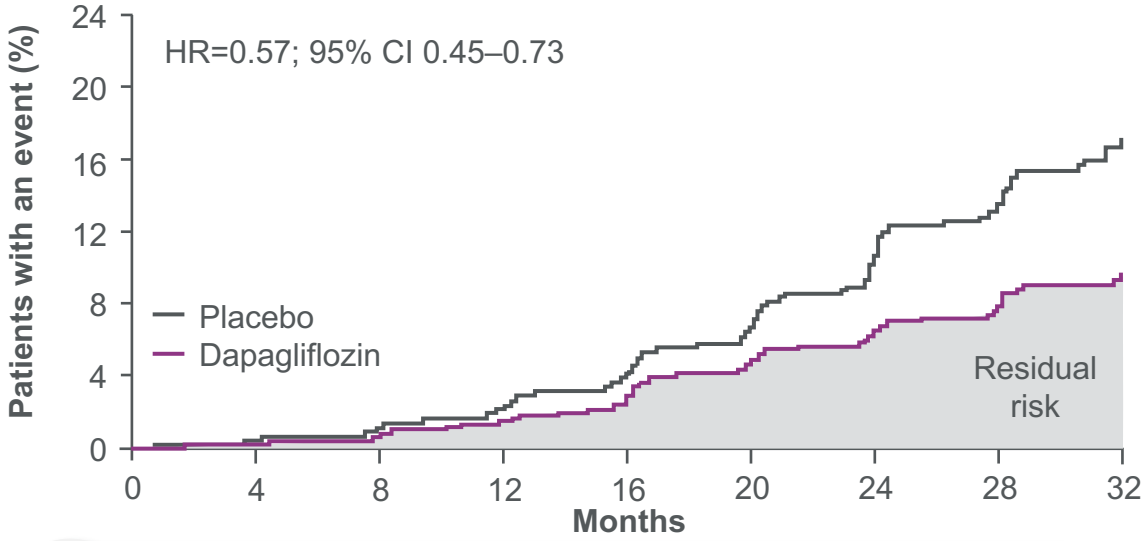
Despite SGLT-2i treatment being recommended for patients with CKD and diabetes,[1] further treatment options are needed

CREDENCE: Canagliflozin (+ RASi) vs placebo[2]



Primary composite outcome:
Kidney failure, doubling of SCr or death from kidney/CV causes

DAPA-CKD: Dapagliflozin (+ RASi) vs placebo (T2D subgroup)[3]



Secondary composite renal outcome:
Sustained ≥50% eGFR decline, ESKD or renal death

CREDENCE and DAPA-CKD have shown that **SGLT-2is offer kidney protection and lower the risk of CV events**; however, in these studies, **CKD progression or kidney failure still occurred in ~7% of patients and CV events in ~5–8% of patients** after a median follow-up of ~2.5 years[2,3]

CI, confidence interval; eGFR, estimated glomerular filtration rate; ESKD, end-stage kidney disease; HR, hazard ratio; RASi, renin–angiotensin system inhibitor; SCr, serum creatinine

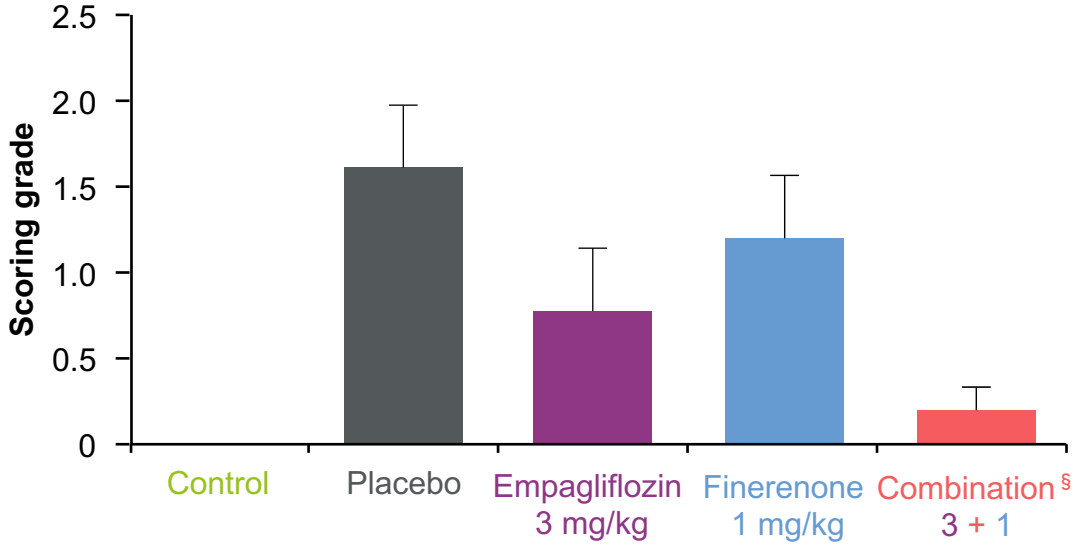
FIDELITY

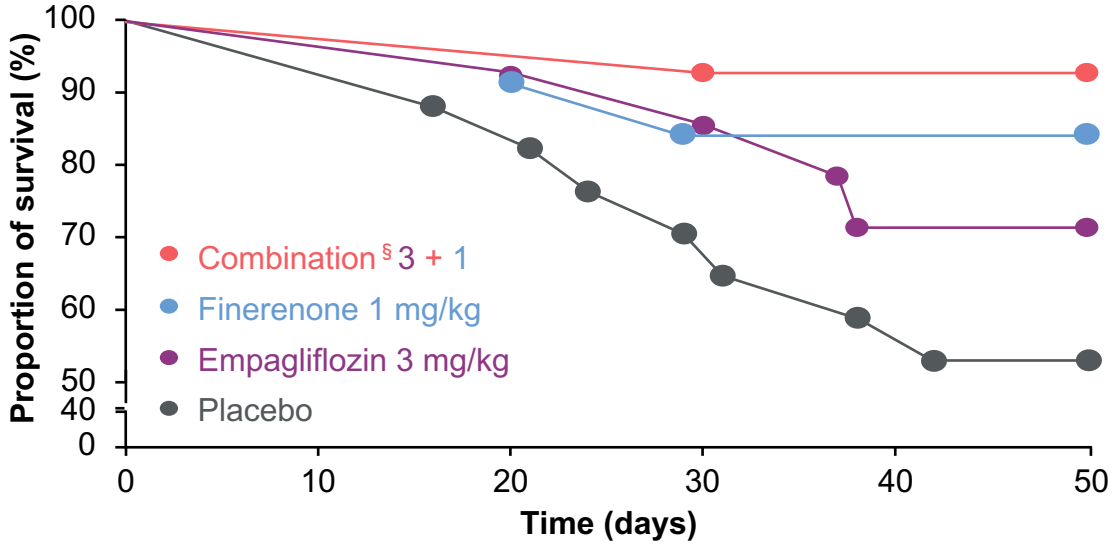
Preclinical data show that combination therapy with finerenone and an SGLT-2i has benefits over monotherapy*

Cardiac fibrosis#



Low-dose combination tended to have more anti-fibrotic effects than each low-dose monotherapy

Survival‡



Greatest survival benefit observed with combined treatment with finerenone and empagliflozin

*CV morbidity and mortality studied in hypertensive, N(ω)-nitro-L-arginine methyl ester-treated, renin-transgenic (mRen2)27 rats; *cardiac fibrosis determined by Sirius Red/Fast Green staining; ‡proportion of survival defined as the absence of mortality and severe morbidity per group over the course of the study; § combination therapy of finerenone (1 mg/kg) and empagliflozin (3 mg/kg); Data are mean ± SEM.

SEM, standard error of the mean

Kolkhof P *et al*. *Am J Nephrol* 2021; doi: 10.1159/000516213

FIDELITY

FIDELITY is a prespecified pooled analysis of individual patient data sets from the FIDELIO-DKD[1] and FIGARO-DKD trials[2]

48 countries

13,171 patients randomized

3 years' median follow-up

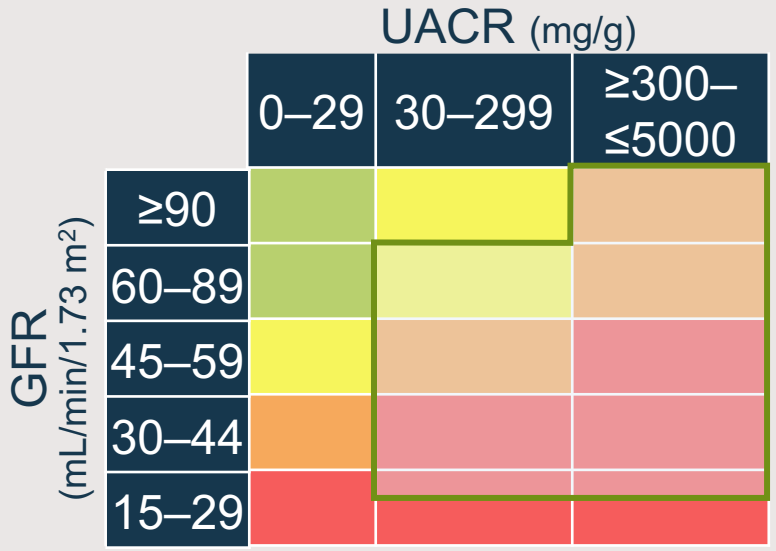
R

Finerenone 10 or 20 mg od*

Placebo

Key eligibility criteria

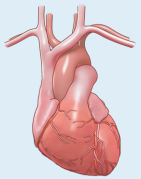
- ✓ T2D
- ✓ CKD
- ✓ On single RASi
- ✓ Serum [K^+] ≤4.8 mmol/L
- ✗ Symptomatic HFrEF



Key outcomes

CV composite

Time to CV death, non-fatal MI, non-fatal stroke, or HHF



≥57% eGFR kidney composite

Time to kidney failure,# sustained ≥57% decrease in eGFR from baseline, or renal death

Aim of this subgroup analysis: To explore the treatment effect of finerenone in patients with and without concomitant SGLT-2i use at baseline

*10 mg if screening eGFR 25–<60 mL/min/1.73 m²; 20 mg if ≥60 mL/min/1.73 m², up-titration encouraged from month 1 if serum [K^+] ≤4.8 mmol/L and eGFR stable; #kidney failure defined as either ESKD (initiation of chronic dialysis for ≥90 days or kidney transplant) or sustained decrease in eGFR <15 mL/min/1.73 m²

GFR, glomerular filtration rate; HHF, hospitalization for heart failure; HFrEF, heart failure with reduced ejection fraction; [K^+], potassium concentration; MI myocardial infarction; od, once daily; UACR, urine albumin-to-creatinine ratio

1. Bakris GB, *et al. N Engl J Med* 2020;383:2219–2229; 2. Pitt B, *et al. N Engl J Med* 2021; doi: 10.1056/NEJMoa2110956

FIDELITY

Patients treated with an SGLT-2i at baseline had a higher eGFR and lower UACR than those not receiving an SGLT-2i at baseline

Patient characteristic*	No SGLT-2i (n=12,149)	SGLT-2i (n=877)

FIDELITY

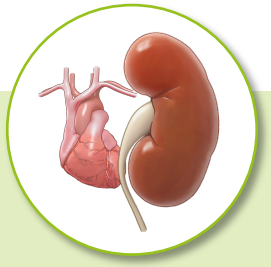
Summary and conclusion

Patients treated with an SGLT-2i at baseline had higher mean eGFR, lower UACR and higher statin and GLP-1RA use



Consistent kidney and CV benefits of finerenone vs placebo were observed, irrespective of SGLT-2i use at baseline

Finerenone improved albuminuria in patients treated with and without SGLT-2is at baseline

Safety outcomes were consistent irrespective of SGLT-2i use at baseline

Further studies are required to clarify any additional clinical benefits with combined finerenone and SGLT-2i therapies in this patient population
